Neurological Rehabilitation - E-Book

2013-08-07 Darcy Ann Umphred Using a problem-solving approach based on clinical evidence, Neurological Rehabilitation, 6th Edition covers the therapeutic management of people with functional movement limitations and quality of life issues following a neurological event. It reviews basic theory and covers the latest screening and diagnostic tests, new treatments, and interventions commonly used in today's clinical practice. This edition includes the latest advances in neuroscience, adding new chapters on neuroimaging and clinical tools such as virtual reality, robotics, and gaming. Written by respected clinician and physical therapy expert Darcy Umphred, this classic neurology text provides problem-solving strategies that are key to individualized, effective care. UNIQUE! Emerging topics are covered in detail, including chapters such as Movement Development Across the Lifespan, Health and Wellness: The Beginning of the Paradigm, Documentation, and Cardiopulmonary Interactions. UNIQUE! A section on neurological problems accompanying specific system problems includes hot topics such as poor vision, pelvic floor dysfunction, and pain. A

problem-solving approach helps you apply your knowledge to examinations, evaluations, prognoses, and intervention strategies. Evidence-based research sets up best practices, covering topics such as the theory of neurologic rehabilitation, screening and diagnostic tests, treatments and interventions, and the patient's psychosocial concerns. Case studies use real-world examples to promote problem-solving skills. Non-traditional approaches to neurological interventions in the Alternative and Complementary Therapies chapter include the movement approach, energy approach, and physical body system approaches. Terminology adheres to the best practices of the APTA as well as other leading physical therapy organizations, following The Guide to Physical Therapy Practice, the Nagi model, and the ICF World Health Model of patient empowerment. Updated illustrations provide current visual references. NEW chapters on imaging and robotics have been added. Updated chapters incorporate the latest advances and the newest information in neuroscience and intervention strategies. Student resources on an Evolve companion website include references with links to MEDLINE and more.

ICF-basiertes Training in der Neurorehabilitation

2021-11-22 Karin Lotter Physiotherapeutische Rehabilitation in der Neurologie mit der ICF führt hin zu einer hohen Lebensqualität der Patient_innen auch bei funktionaler und struktureller Beeinträchtigung. ICF in der Neurorehabilitation Die International Classification of Functioning, Disability and Health (ICF) der WHO stützt sich auf das bio-psycho-soziale Modell: Es orientiert sich an der Frage, wie Patient_innen und Klient_innen trotz und mit Beeinträchtigungen eine hohe Lebensqualität und Wohlbefinden gewinnen. Damit setzt sie einen neuen Maßstab in der Gesundheitsversorgung und erklärt die funktionale Gesundheit des Menschen, seine Teilhabe und

Umweltbedingungen zum Schwerpunkt der professionellen Dienste der Gesundheitsberufe. Das Fachbuch stellt ein ICF-basiertes Training als Konzept für die physiotherapeutische Therapieplanung vor, evidenzbasiert auf Erkenntnissen der neurologischen Rehabilitation. Es verortet die Beschwerden neurologischer Patienten in die Struktur der ICF und unterstützt die Auswahl geeigneter Instrumente zur Messung und Befundung (Assessments), damit sie differenziert und umfassend erhoben werden können. Daran schließt sich die Auswahl und Anwendung der therapeutischen Maßnahmen an. Es bietet daher ein weites Spektrum für das professionelle Handeln der Physiotherapie und unterstützt die interdisziplinäre Zusammenarbeit. Zur Struktur des Inhalts: •Grundlagen der ICF für die Neurorehabilitation •ICF-basiertes Training: Assessment, Diagnostik, Planung, Therapieziele, Behandlung •Fallbeispiele und Erkrankungen: Schlaganfall, Multiple Sklerose, Ideopathisches Parkinson-Syndrom (IPS), Querschnittsläsion (QS)

NEUROLOGICAL REHABILITATION

2013-01-10 Anne L. Foundas Apraxia is a cognitive-motor disorder that impacts the performance of learned, skilled movements. Limb apraxia, which is the topic of this chapter, is specific to disordered movements of the upper limb that cannot be explained by weakness, sensory loss, abnormalities of posture/tone/movement, or a lack of understanding/cooperation. Patients with limb apraxia have deficits in the control or programming of the spatial-temporal organization and sequencing of goal-directed movements. People with limb apraxia can have difficulty manipulating and using tools including cutting with scissors or making a cup of coffee. Two praxis systems have been identified including a production system (action plan and production) and a conceptual system (action

knowledge). Dysfunction of the former produces ideomotor apraxia (e.g., difficulty using scissors), and dysfunction of the latter induces ideational apraxia (e.g., difficulty making a cup of coffee). Neural mechanisms, including how to evaluate apraxia, will be presented in the context of these two praxis systems. Information about these praxis systems, including the nature of the disordered limb movement, is important for rehabilitation clinicians to understand for several reasons. First, limb apraxia is a common disorder. It is common in patients who have had a stroke, in neurodegenerative disorders like Alzheimer disease, in traumatic brain injury, and in developmental disorders. Second, limb apraxia has real world consequences. Patients with limb apraxia have difficulty managing activities of daily living. This factor impacts healthcare costs and contributes to increased caregiver burden. Unfortunately, very few treatments have been systematically studied in large numbers of patients with limb apraxia. This overview of limb apraxia should help rehabilitation clinicians to educate patients and caregivers about this debilitating problem, and should facilitate the development of better treatments that could benefit many people in the future.

Neurological Rehabilitation

2013-01-10 Tomoko Kitago Neurorehabilitation is based on the assumption that motor learning contributes to motor recovery after injury. However, little is known about how learning itself is affected by brain injury, how learning mechanisms interact with spontaneous biological recovery, and how best to incorporate learning principles into rehabilitation training protocols. Here we distinguish between two types of motor learning, adaptation and skill acquisition, and discuss how they relate to neurorehabilitation. Functional recovery can occur through resolution of impairment (reacquisition of premorbid movement patterns) and through compensation (use of alternative movements or effectors to accomplish the same goal); both these forms of recovery respond to

training protocols. The emphasis in current neurorehabilitation practice is on the rapid establishment of independence in activities of daily living through compensatory strategies, rather than on the reduction of impairment. Animal models, however, show that after focal ischemic damage there is a brief, approximately 3-4-week, window of heightened plasticity, which in combination with training protocols leads to large gains in motor function. Analogously, almost all recovery from impairment in humans occurs in the first 3 months after stroke, which suggests that targeting impairment in this time-window with intense motor learning protocols could lead to gains in function that are comparable in terms of effect size to those seen in animal models.

2022-06-20 Abraham M. Joshua This is a comprehensive book on physiotherapy for adult neurological disorders with chapters describing physiotherapy assessment and management for those adult patients in the acute care and rehabilitation units of hospitals or centers. Each chapter additionally provides brief introduction, historical background, etiology, pathophysiology, clinical manifestations, medical and surgical management. The aim is to help build a theoretical foundation on which principles of management are laid, and to improve and update the readers' clinical and therapeutic skills. Improving the overall care and management of patients suffering from adult neurological conditions such as stroke, Parkinson's disease, traumatic brain injury, and multiple sclerosis, is the key objective. Supported with ample practical contents (exercise training and therapeutic strategies) and pictures it prepares the readers to effectively manage patients with neurological conditions. The contents of this book will serve as a guide and source of knowledge of both contemporary and advanced treatment techniques for undergraduate and post-graduate students and therapists practicing worldwide in adult neurological physiotherapy.

Neurological Rehabilitation

2013-01-10 V. Dietz This chapter deals with the neuronal mechanisms underlying impaired gait. The aim is, first, a better understanding of the underlying pathophysiology and, second, the selection of an adequate treatment. One of the first symptoms of a lesion within the central motor system perceived by patients is a movement disorder, which is most characteristic during locomotion, e.g. in patients suffering spasticity after stroke or a spinal cord injury or Parkinson disease. By the

recording and analysis of electrophysiological and biomechanical signals during a movement, the significance of impaired reflex behavior or muscle tone and its contribution to the movement disorder can reliably be assessed. Adequate treatment should not be restricted to the correction of an isolated clinical sign but should be based on the mechanisms underlying the movement disorder that impairs the patient. Therapy should be directed toward functional training, which takes advantage of the plasticity of the nervous system. In the future a combination of repair and functional training will further improve the mobility of disabled patients.

NEUROLOGICAL REHABILITATION

1998 Janet H. Carr Neurological Rehabilitation is a completely revised and thoroughly updated replacement for Physiotherapy in Disorders of the Brain which was published in June 1980. Many advances have been in the understanding and treatment of adults with injuries to the brain, whether caused by accident or disease, and this book will incorporate these changes.

Neurological Rehabilitation

2013-01-10 Volker Hömberg Over the last decade a dramatic change has occurred in the field of neurorehabilitation in motor recovery that is marked by three transitions: first, by movement away from intuitive and ideology-based approaches to evidence-based therapy practices; second, by a change from hands-on treatment of patients to hands-off coaching approaches by motor therapists, who incorporate knowledge about motor reorganization and motor learning; and, finally, by a transition from one-on-one treatments to group-oriented treatments. General rules (such as the need for repetition, feedback of results, shaping task difficulty) have been derived from the animal experimental and human behavioral literature and incorporated into the design of innovative treatment strategies that can be adapted to individual patients' needs. This chapter reviews the state of the art for most of the evidence-based motor therapy concepts in the rehabilitation of patients with motor deficits after stroke, traumatic brain injury, etc., and other conditions. Treatment approaches derived from neuromodulation techniques such as stimulation or blockage of peripheral nerves, noninvasive brain stimulation, and pharmacological means are addressed. Finally, a modular concept is proposed to define optimal therapeutic approaches according to the individual level and type of impairment.

Improving Functional Outcomes in Physical Rehabilitation

Science-based Rehabilitation

2005-01-01 Elizabeth Ellis (MSc.) Physiotherapy as a profession has changed radically in the last few years with the rapid development of interventions based on a wider and sounder theoretical basis, the development of reliable measurement tools and vigorous testing of outcomes. Science-based Rehabilitation describes various aspects of rehabilitation by a distinguished group of international contributors who share a passion for scholarship and a vision of translating theory into practice. The authors cover assessment through to the nature and contribution of impairments to disability and finally handicap and reflect the research outcomes of physiotherapists. It is a clear illustration of where we are now and where we have come from.

Neurological Rehabilitation

2013-01-10 Randolph J. Nudo Over the past two decades, results from neurophysiological studies in animal models and neuroimaging studies in human populations have converged along a common thread. Neuroplasticity in the remaining, intact tissue accompanies functional recovery after brain injury. Now, virtually every new therapeutic approach in postinjury rehabilitation relies on the fundamental principles of neuroplasticity for theoretical validity. In this chapter, the basic tenets of plasticity are outlined, and the neural substrates in the cerebral cortex that may subserve recovered functions are reviewed.

Neurological Rehabilitation

2013-01-10 Zachary Simmons Amyotrophic lateral sclerosis (ALS), the most common adult motor neuron disease, is an acquired disorder that results in loss of function in multiple domains. Although there is no treatment that can halt or reverse this progressive condition, there are many opportunities for interventions that can lead to improved quality of life for the patient and caregiver. Physical and occupational therapy can assist with mobility and activities of daily living. Interventions by speech pathology can optimize nutrition and communication. Respiratory function can be managed noninvasively or invasively. Depression, hopelessness, anxiety, and other mental health issues can and should be aggressively addressed and treated. Many symptoms such as pseudobulbar affect, sialorrhea, constipation, spasticity, and cramps can be treated effectively with medications. Spirituality and religion are important issues to address, as are end-of-life concerns, including advance directives, hospice, and the dying process. In contrast to the discouraging view that “there is nothing we can do,” a broad approach to management, through collaboration with a multidisciplinary team, will permit the ALS physician to make a meaningful difference in the lives of individuals living with ALS.

Neurological Rehabilitation, 2/e

2011-07-06 Janet H. Carr Janet Carr and Roberta Shepherd head up a new team of eminent authors for the second edition of this definitive text on neurological physiotherapy. In the first edition, the authors described a model of neurological rehabilitation for individuals with motor dysfunction based on scientific research in the areas of neuromuscular control, biomechanics, motor skill learning, and the link between cognition and action, together with developments in pathology and adaptation. The new edition continues to advance this model while identifying and incorporating the many advances that have occurred in the last decade in the understanding and treatment of adults with neurological conditions, whether caused by accident or disease. Among these advances is the knowledge that the brain retains a plastic potential to reorganize, even in old and/or lesioned brains, and that neural plasticity can be influenced by task-related mental and physical practice in a stimulating environment. There is also an increasing body of knowledge related to the musculoskeletal system's adaptability and the need to prevent length and stiffness- related changes in muscle contractility, together with loss of aerobic fitness and endurance. There is an expanding body of clinical research that appears to support the model provided here. The training guidelines outlined in Neurological Rehabilitation are based on biomechanical constructs and motor relearning

research, applied to enhance brain reorganization and muscle contractility, and encourage functional recovery of the patient. It connects science and clinical practice enabling students and practitioners to develop their knowledge and use new clinical methods based on modern scientific understanding. All chapters have been revised, some with the collaboration of five specialists who are engaged in high level scientific research and clinical practice Biomechanical models are presented to provide a framework for action-specific training and exercise to improve performance Clinical guidelines are science- and evidence-based Emphasis is on new approaches to the delivery of neurological rehabilitation that increase the time spent in mental and physical activity, and the intensity of practice and exercise Up-to-date referencing

Functional Rehabilitation of Some Common Neurological Conditions

2019-03-01 Sayeed Ahmed MCSP. A kinematic motor organisation which is crucial for performing different functional tasks is mediated by a distinct motor functional architecture of the central nervous system. A breakdown of this architectural network occurs in most neurological condition with motor impairment. Therefore a planned physical intervention to restore impaired structure

architectural network of the brain is essential for the functional recovery. This book has dealt with four common conditions and for each condition it has identified structure of architectural network is damaged. Then the intervention strategy has elaborated the some of the precisely shaped stimulation that can restore the impaired structure, which has used wide range of research based evidences.

Neurological Rehabilitation

2013-01-10 Adolfo M. Bronstein This chapter addresses the important and undertreated problem of balance disorders. The chapter has a simplified summary of the physiology of balance problems in order to set the scene. The issue of assessment is next addressed with discussion of important tests including the Berg Balance Scale and the Get Up and Go Test, and others. Posturography is discussed as well as assessment of the gravitational vertical. The assessment of vestibular function is of key importance and discussed in some detail. The focus of the chapter is on balance rehabilitation. Re-training of postural alignment and of sensory strategies are key but adaptation of the environment and re-training of cognitive strategies are also helpful in individual cases. Vestibular exercises can also be used. The chapter then critically analyses the efficacy of these treatments in specific balance disorders such as in stroke, Parkinson disease, polyneuropathies, multiple sclerosis, and vestibular disorders. Overall, there is a growing body of evidence that balance rehabilitation improves symptoms, function, and quality of life for those troubled by these disabling problems.

2019-12-08 Lars Lienhard Sie wollen Ihre körperliche, geistige und emotionale Gesundheit verbessern? Dann richten Sie Ihre Aufmerksamkeit auf die wichtigsten Bereiche des Körpers: auf Gehirn und Nervensystem. Lars Lienhard und Ulla Schmid-Fetzer, die führenden Experten für neurozentriertes Training in Europa, zeigen in Zusammenarbeit mit Dr. Eric Cobb, dem weltweit führenden Experten für neurologisch ausgerichtete Sportprogramme, wie Gehirn und Nervensystem sämtliche Prozesse im Körper kontrollieren und durch spezifische Übungen unterstützt werden können. Eine zentrale Rolle spielt dabei der Vagusnerv, der an der Regulation fast aller Organe beteiligt ist und einen großen Einfluss auf Gesundheit und Wohlbefinden hat. Gemeinsam mit der Inselrinde, einem Hirnareal, in dem Informationen aus dem Körperinneren mit Sinneseindrücken abgeglichen werden, bildet er die Grundlage unserer Selbstwahrnehmung. Durch ein gezieltes Training des Vagusnervs und der neuronalen Komponenten unserer inneren Wahrnehmung können Sie Depressionen, Ängste, Verdauungsprobleme, aber auch Schmerzen, Bewegungsstörungen und Stresssymptome einfach und effektiv selbst behandeln. Reactions And Research

Not everyone is impressed with acupuncture itself. Most western medical professionals have expressed either doubt or indifference to the oriental method while others have downright driven it down into the earth with criticisms and brutal skepticism. However, recent research shows the efficacy (or lack thereof) of acupuncture, and while more research has to be done, it has been proven to actually positively affect some, but not all, forms of ailments that it claims to cure.

So as the doors open to a new age of acupuncture, give it a try when you feel the need for pain relief and you will not be disappointed. As the Chinese have used it for many centuries, so should we.

Moreover, an acupuncturist may prescribe herbal supplements to aid the patient in quitting efforts. During treatment, filiform needles are inserted into specific points on the ear cartilage, as well as the hands and wrists. Normal procedures last for about 30 minutes. Body acupuncture can be used in combination with the ear and wrist needle placements. An acupuncturist may also utilize a mild electric current, to enhance the effect of the needles through the body.

Semi-Open Adoption:

A modification of the above arrangement, semi-open adoption involves significantly less involvement in the child's life on the part of the birth parent(s). Adoptive parents and birth parents may still meet face to face prior to undertaking the adoption process, but typically there is no physical contact beyond that. The birth parents and the child may occasionally exchange photos or letters.

Closed Adoption:

In this type of adoption, minimal information is shared between birth and adoptive parents prior to placement. After the finalization of the adoption, adoptive and birth parents share no information. This type of adoption can take place in cases of child abuse or neglect, or when the birth parent(s) has(have) specified that they want no contact.

The adoption records also include information on the birth parents and the birth family of the child being put up for adoption. This information is gathered during a home study as well and it includes information such as the medical and genetic history of the family, the family and social background, a mental health history of the family, a religious background, and the level of education attained by the parents. Some states require also the physical appearance, talents, hobbies, field of occupation, and a list of any drugs the birth mother took during her pregnancy with the child. There are a few states that if obtainable, will also provide the adoptive parents with the names, addresses and any other identifying information about the birth family. These states are Colorado, New York, and American Samoa.

You should of course also find information on the adoptive family in the adoption records.

Once a family has been chosen for a child they do a check on the family to make sure that the home will be suitable for the child being adopted. The information that they collect is relatively simple. When they do the home study for the adoptive family they include such things as a criminal background check, and they also check with the local child abuse registry. They will also include the adoptive parents physical health, emotional maturity, financial situation, and a family and social background.

Montana seems to be the hardest state to adopt from, they ask for Employment history, history of drug and alcohol abuse, racial ethnic background, and a history of domestic violence.

Montana isnt the only state that asks for these, they are the only one that asks for all of them.

Michigan, New Mexico, New York, North Carolina, Oklahoma, Rhode Island, South Dakota, West Virginia, Puerto Rico, Pennsylvania, Vermont, Colorado, Illinois, Arizona, and the District of Columbia also ask for some of these items for the adoption records.

A Primer on Medical Acupuncture

Have you ever had an uncontrollable urge to be pierced by a dozen needles? This is the image most people get when someone mentions the word “acupuncture”. It comes as no surprise that most view this technique with suspicion, even downright horror. The fact is, however, that this relatively painless ancient Chinese technique has helped relieve the symptoms of millions of people. Properly used, it can help in the management of many medical conditions including chronic pain and fatigue.

How does needle puncture work?

Practitioners of Chinese traditional medicine believe in energy flows. This energy, called Qi, circulates around the body using pathways called meridians. Meridians run very close to the surface of the skin in certain areas and can be accessed by needles. Much like plumbing, these pipes can get blocked or go the wrong way, causing health problems. The insertion of needles at these points is aimed to help loosen blocks and normalize flow.

Story of " Neurological Rehabilitation Optimizing Motor Performance.In Guatemalan adoptions you can be married, or single, meaning single men and single women can adopt. The only real requirement is that the adopting parents be under the age of fifty years old. Referrals generally start around three to six months after your paperwork has been received. Once you accept a referral it takes about eight months for the adoption to become final.

An international protocol was endorsed by law makers, because the United States said they will stop allowing American parents adopt Guatemalan children. Guatemala has been told that it needs to make provisions of its secret systems. These systems have been criticized due to high adoptive cost and for payment being made to the women and young girls placing their children up for adoption. Guatemalan adoption is still probably on the better choices for single adoptive parents due to the flexibility of their current protocol. Also with private lawyers currently still in charge of a great deal of the process, this is also a good alternative for people currently turned down for domestic adoption.

When choosing to adopt a child, some prospective parents make the decision to partake in an international adoption. That is, they choose to adopt a child from a country other than their own. This process can be long and full of bureaucratic red tape, especially since it is a matter

conducted entirely between the potential adoptive parents and a foreign court, which acts on behalf of the foreign government. The United States government cannot intervene on the parents behalf. There a few reasons and some benefits to this option, however.

Legend Neurological Rehabilitation Optimizing Motor Performance~For those interested in international adoption, there are a number of resources available. First of all, it is advisable to first learn about domestic open adoption and explore domestic options before looking abroad. There can be certain risks associated with international adoption. That said, there are many children available in more than fifty countries, all of whom who are legally free for adoption and are in need of caring homes.

A final word: international adoption is a long process full of bureaucratic hurdles. It can be costly and may require prospective parents to reside in the country of the childs origin for a period of time before the process is complete. Like all things that require effort, however, people who endure the process ultimately find it to be worthwhile.

International adoption offers may benefits and a few hardships. The pros of international adoption are as follows: there are a lot of children to be adopted of both sexes, from infancy and up in age. Once you have an accepted home study you are all but guaranteed a child. With international adoptions you know how long it will take (usually around twelve to eight-teen months). The natural mother will not change her mind, all the children for international adoption are orphans. Once you agree to a referral you will become the parent of that child. You will know in advance how much all the fees are. You will get to travel to another country. The cons are as follows: you will not get a newborn; most infants are at least four months old.

The Childs heritage and medical information is not always known. The child might have development problems, but should bounce back quickly. There is a ton of paperwork required.

The treatment is finished after an hour and when the needles are removed, you are advised to wear ear magnets so your session continues even when you leave the clinic. While acupuncture itself is a painless procedure, some smokers have claimed that they felt a prick or get sleepy.

Most smokers will have to come to the clinic 4 to 6 times before seeing any significant results. Just to give you an idea, one study shows that the respondents reported a decrease in the number of cravings to smoke just after one or two sessions. Seven out of 10 of the respondents were able to kick the habit after 5 or 6 sessions.

Because the number of test subjects is small, there are some who doubt the effectiveness of acupuncture. This is because although there are positive signs with regards to the short term effects of this technique, its effects were not sustained. This is why some medical journals have stated that it is unclear what acupuncture can do in smoking cessation.

Lolita Neurological Rehabilitation Optimizing Motor Performance-How does sticking needles into your body help manage the stress?

In traditional Chinese medicine, much of the treatments depend on an understanding of the balance in our bodies and its internal organs. The sicknesses we sometimes develop are seen to be caused by imbalances in our lifestyles and environment. Stress is also affected by this

imbalance. That is why when there is something wrong with your body, you typically have less of an ability to deal with stress. You get more irritable and find it really difficult to relax.

By sticking these very thin needles past the surface of our skin, the acupuncturist stimulates nerves in our body. These nerves send signals to our brain and scientists believe that the brain then releases its natural painkillers into our system. This immediately causes a feeling of relaxation for many people.

The needles could also help your body by stimulating its circulation. With the circulation between the organs of the body improved, a lot of the body's wastes could be cleansed properly. Your organs would also receive the full benefit of the oxygen from your lungs making its way into the cells of your body without any blockages. This makes your organs much healthier and leaves you feeling much better in the long term as well.

There is also auricular acupuncture where it is believed that the ear is a microcosm of the body. This means that acupuncture needles are placed on certain points on the ear so it can treat certain addiction disorders.

Myofascially-based acupuncture is often utilized by physical therapists as it involves feeling the meridian lines in search of tender points before applying needles as this is where abnormal energy flows.

Japanese styles of acupuncture referred to as "meridian therapy," tend to put more emphasis on needling technique and feeling meridians in diagnosis.

Neurological Rehabilitation Optimizing Motor Performance;But, before finally deciding to bring teens to a specific vacation destination, make sure that you consider the tips below.

1. Get their opinion. Unlike kids, teens are harder to convince in so many things. This is because they feel that they are old enough to take care and decide for themselves. To avoid conflicts and causes of arguments, make sure that you ask the teeners first about your plan. If you do this, they can suggest places where they want to go. Take note of the places or destinations that they have mentioned and conduct as simple research. List down the top three possible options and let them decide on it.

2. Never force them to go to a place that they don't like. Parents should realize that teeners are starting to crave for independence. If they continue to command their kids and force them to do the things that they don't really like, chances are, the trip would not be successful at all because nobody from them will cooperate.

3. Always be prepared. Wherever you go for an adventure vacation, make sure that you are

well prepared. Some of the things that you should plan ahead is the time and length of your stay in a specific place, how to get there, the available accommodation and places where you can stay, the availability of basic travel necessities, the food available in case the teeners don't like the local food, the activities that you can do, the places that you should not miss to visit, and of course, your budget.

It is important to know when air ambulance service is covered, when it is available, and at what charge to you.

Power Neurological Rehabilitation Optimizing Motor Performance: **Celebrity Branding**

Celebrity branding is a method of advertising which uses the services of a celebrity to promote a product or service with the help of their fame and status in the society. This method has several approaches; it can involve a celebrity simply appearing in a commercial and the celebrity can be signed for attending events for promotion. Another method is to start a product line using their name as a brand. Perfume and garments are the largest product lines involving such a promotion. All the top actors, singers and models are known to give their name to a certain brand or licensed products. Jennifer Lopez started her own line of clothing a while ago which features designer clothes personally designed by her.

A customer's buying behavior is hugely influenced by famous people. Marketing experts, using associative learning principles, analyzes the lifestyle of the celebrities to properly assign them to the brand which depicts them perfectly. Their fashion sense, appeal, awareness, fame and public image are reviewed thoroughly to assign them the right charity work or product.

Repetition, blocking, CS pre-exposure, extinction, overshadowing, belongingness, and association set size are the principles on the basis of which analysis is done like the famous Miss World Aishwarya Rai of India who has very beautiful eyes was chosen to campaign for eye donation project. Some of the celebrities are known for their distinct voice. This concept led to the voice-over method in advertising. Their voices merely attract customers when used in a commercial.

Today, nearly twenty percent of the advertising industry utilizes celebrity endorsement. A celebrity is bound to endorse many products and brands over a course of time. Each time a different image of the celebrity is being projected to the public. The company should keep in

mind the previous identity and play accordingly. Projecting a different person every time will sustain the interest of the customers, but at the same time the two identities shouldn't conflict with each other. The captain of England soccer team David Beckham has endorsed many products. While advertising for Gillette, his taste for hairstyles was considered and he was given a bald look. When campaigning for Police his passion for fashion was portrayed all over and heavily jeweled David Beckham was depicted.
